Molecular and Cellular Immunology. The section of Molecular and Cellular Immunology at ICH researches into the molecular basis of primary immunodeficiency disorders, and other related haematopoietic disorders and is developing improved forms of treatment. One such form of treatment is somatic gene therapy, which has become a reality with the initiation of clinical trials for three life-threatening primary immunodeficiency disorders.

Abstract. Patients with primary immunodeficiency diseases most often are recognized because of their increased susceptibility to infection (chronic or recurrent infections without other explanation, infection with an organism of low virulence, or infection of unusual severity). However, these patients may also present with autoimmune or inflammatory disorders (e.g., hemolytic anemia, inflammatory bowel disease, vasculitis, or systemic lupus erythematosus) or as part of a syndrome complex ...

The primary immunodeficiency field can be considered as a model to illustrate the power of molecular medicine, and it is therefore useful to describe some of its achievements and how they were obtained. Classically, primary immunodeficiency disorders are classified into T lymphocyte, B lymphocyte, phagocytic cell, and complement deficiencies.

The immune system is able to recognize and eliminate tumor cells. Some tumors, including colorectal cancer (CRC), induce immune tolerance via different mechanisms of "immunoediting" and "immune evasion" and can thus escape immune surveillance. The impact of immunotherapy on cancer has been investigated for many years, but so far, the application was limited to few cancer types.
